

How to use code for Perspective API

Go to my repo (https://github.com/ykim71/google_toxicity)

Click 'google_toxicity.ipynb' and click

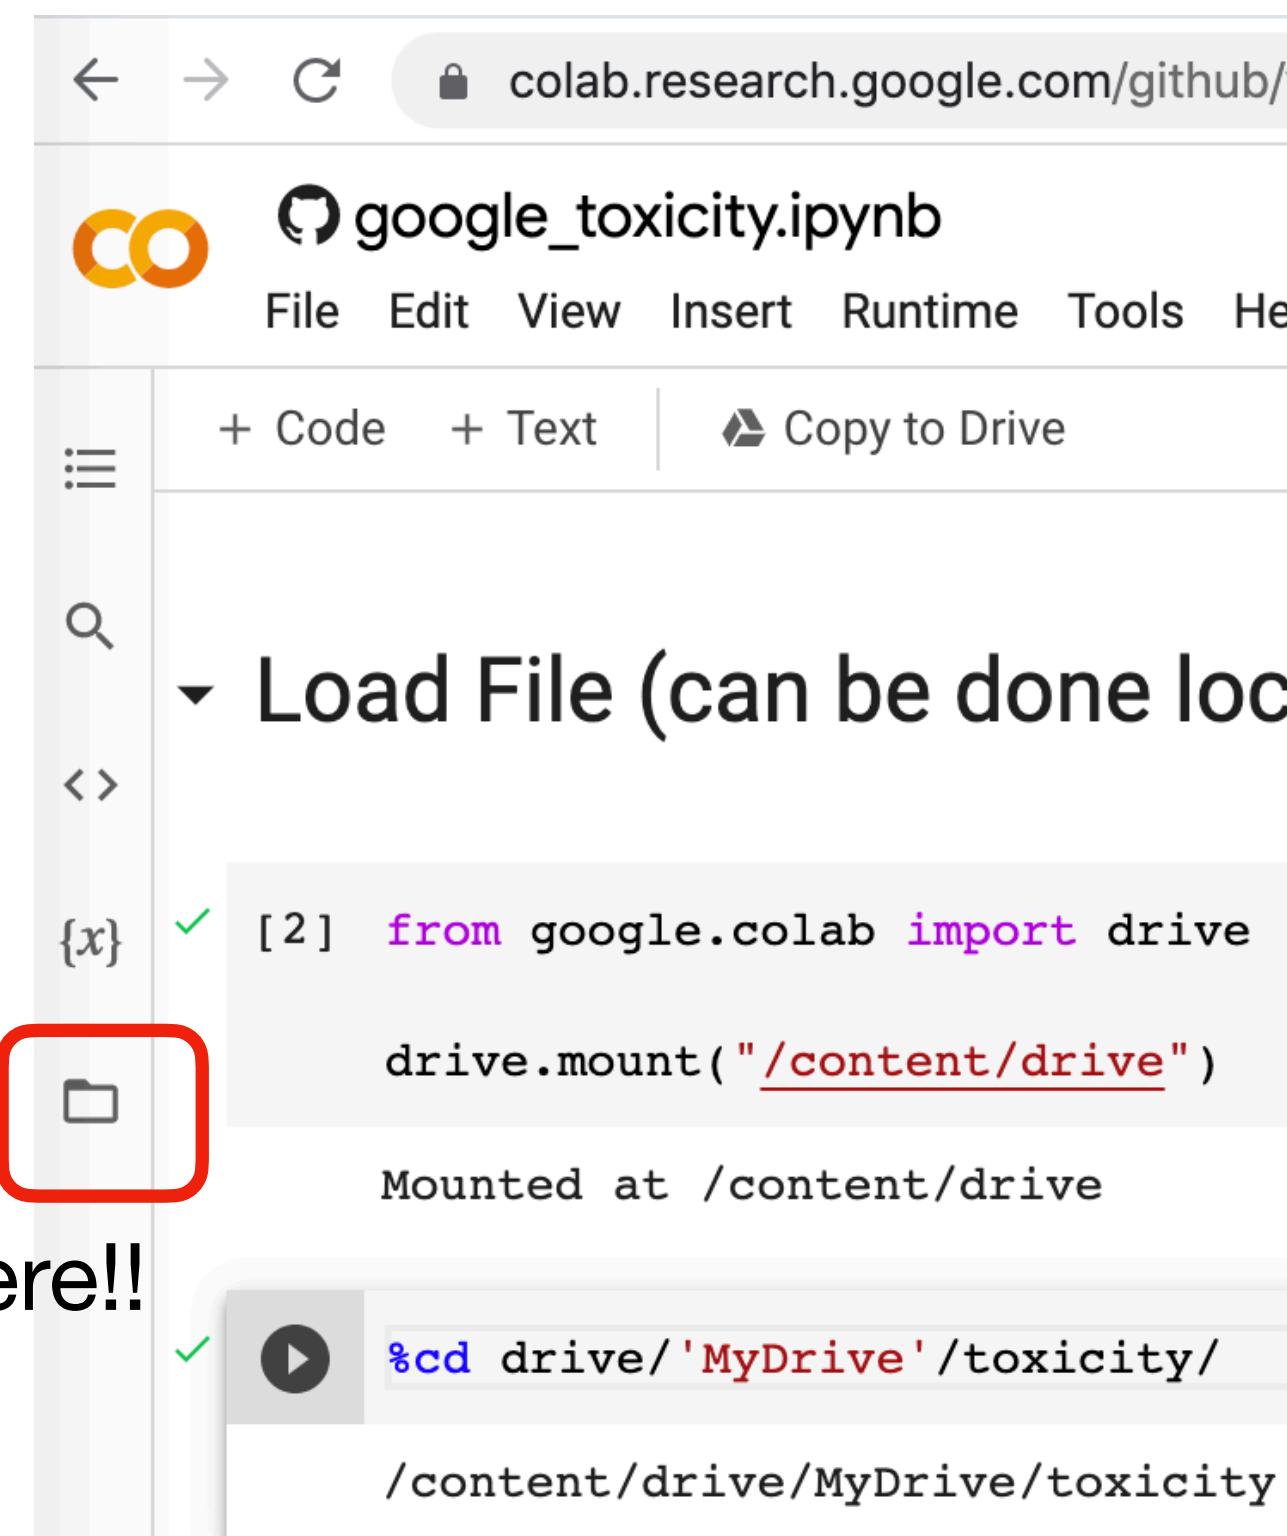

Once you're at the python code on Colab,

1) Connect your Google Drive to Colab

- Run the first code and it will bring your Google account access permission. This directly gives access to any file in your Gdrive.
- The second code is for changing your working directory.

2) Or, Upload your file directly to Colab.

- Run the 3rd code and you can select your file on your local environment.
- You can find your files at the folder icon at left side.

Computing Toxicity

Once your file is connected to Colab, load it your file name as a variable. See comments on 'load your file to Colab'

Follow guidelines and codes under 'Perspective API toxicity'. Before running codes, read the comments on the code block. I added explanations in detail.

You don't need to change any codes much other than adding your API key and renaming the data file or column, but there is one code block you need to change according to your data and text column name.
